
How to Expand JBOD for NVR7316

Application Notes

Version <1.0>

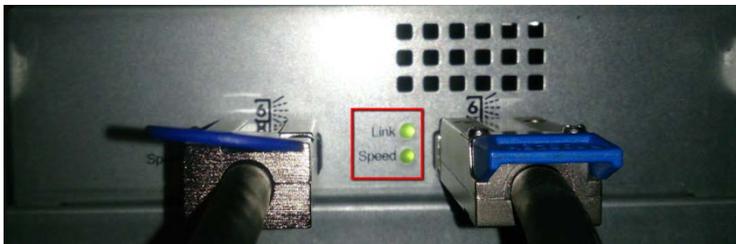

Technical Support Team

[Pre-Procedure before You Start]

- The maximum capacity of big single RAID is up to **128TB** (8TBx16).
- In 3.3.A01 version and below, NVR7316 does not support HDDs over 5TB yet.
- Surveon recommends users to build UPS devices for NVR7316.
- If users use 6TB or 8TB HDDs for NVR7316, it requires at least 10 minutes to mount or format the RAID.

[Notice]

- For each storage device (such as NVR7316 local storage and each daisy-chaining JBOD), users can create multiple RAIDs. Please note that do not create a RAID from cross-platform storage. For example, do not create a RAID when combines JBOD1 and NVR7316's local storage into one RAID. Or do not create a RAID combining JBOD1 and JBOD2.
- When create a RAID, please start from the beginning of booting order. In this case, the sequence for creating RAID should be NVR7316 > JBOD1 > JBOD2 > JBOD3.
- After connecting SAS cables between NVR7316 and JBODs, please follow this booting up sequence: JBOD3 > JBOD2 > JBOD1 > NVR7316. Power on JBOD3 firstly and NVR7316 finally. When you follow the booting order, check and confirm whether the light already turns to green, and then boot next device.

[Expand JBODs for NVR7316]

1. Setup JBOD ID

- Please switch JBOD ID for each JBOD. ID should be from 1 to 3.
In this case, we recommend you setup ID as the following rules:
JBOD 1, ID =1.
JBOD 2, ID =2.
JBOD 3, ID =3.

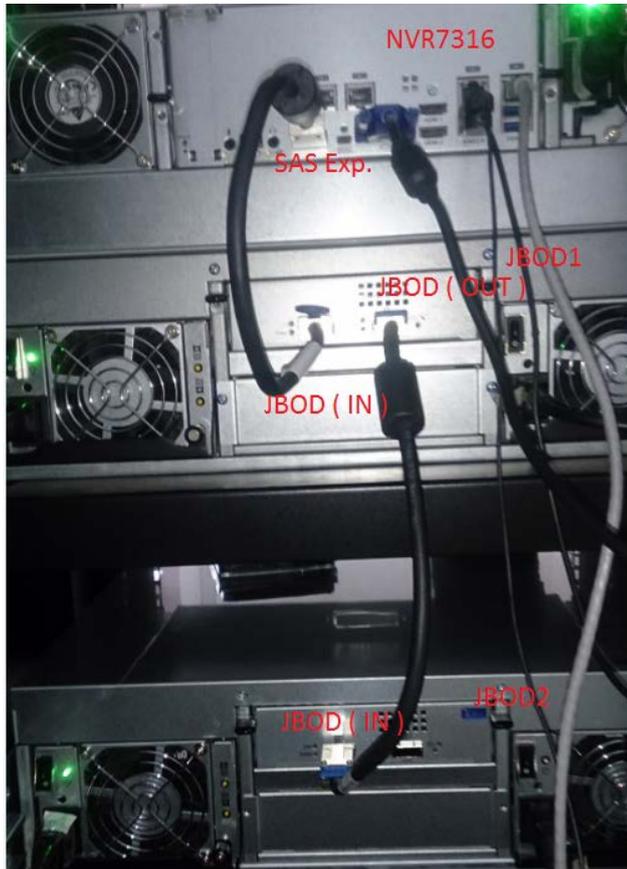

2. Connect SAS Cables to SAS Expansion Ports

- Connect NVR7316 and JBODs as below:

NVR CH1>JBOD1's IN Port

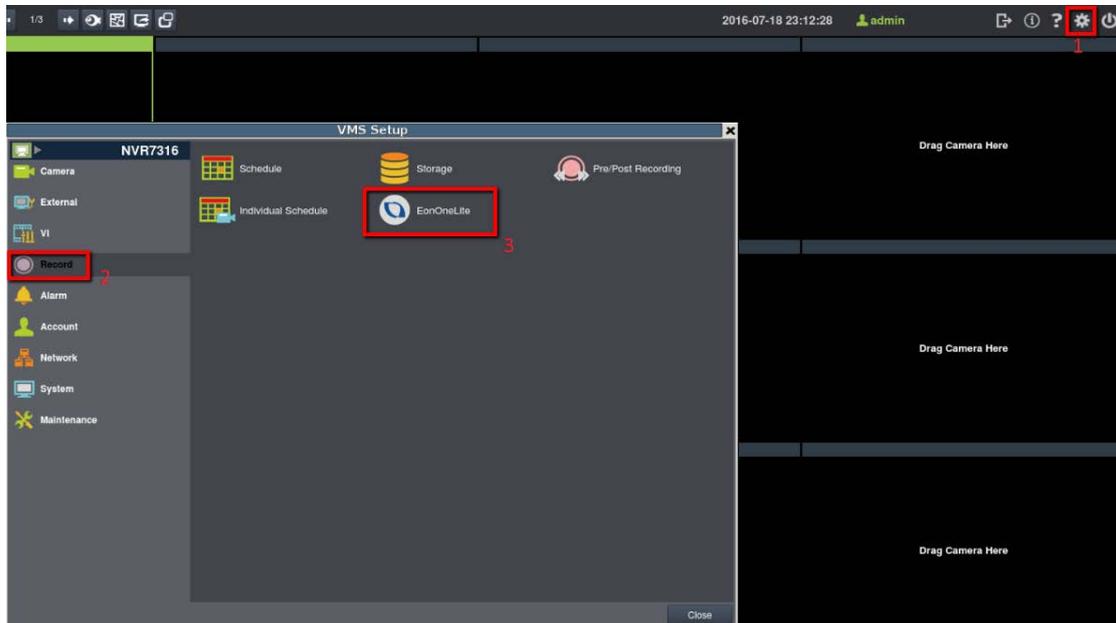

JBOD1's OUT Port>JBOD2's IN Port

JBOD2's OUT Port>JBOD3's IN Port

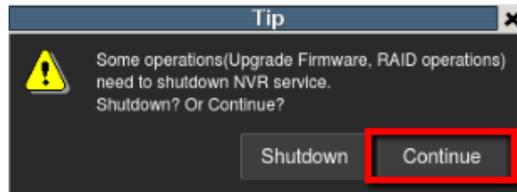

3. Create a RAID Array on NVR7316 System.

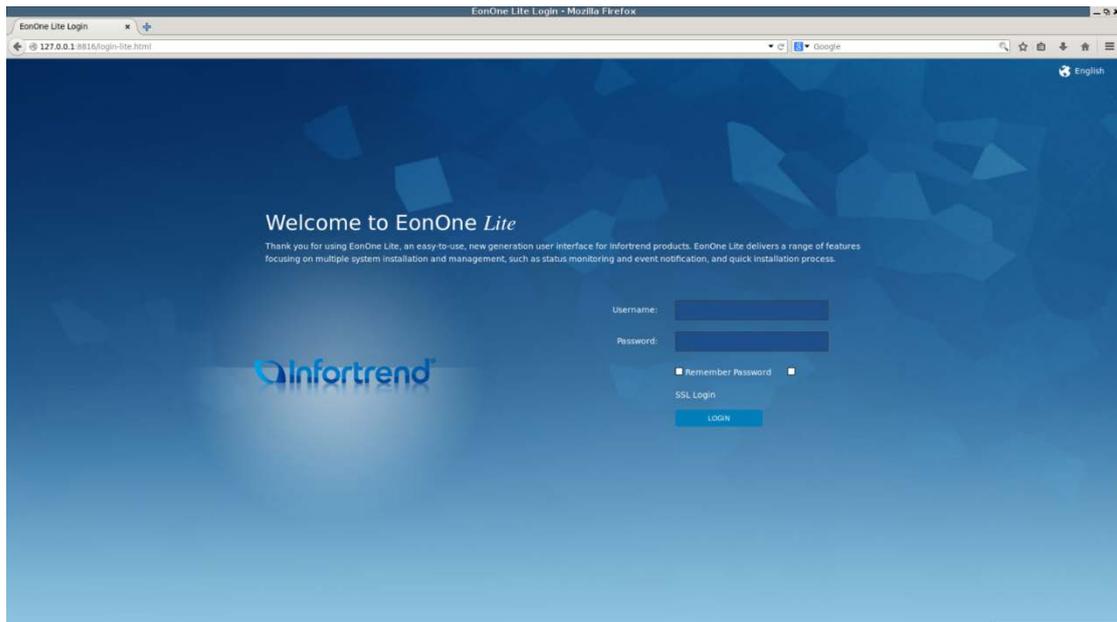

- Firstly, place HDDs into NVR7316.
- Go to “Setup” ⚙️>“Record”>“EonOneLite”.

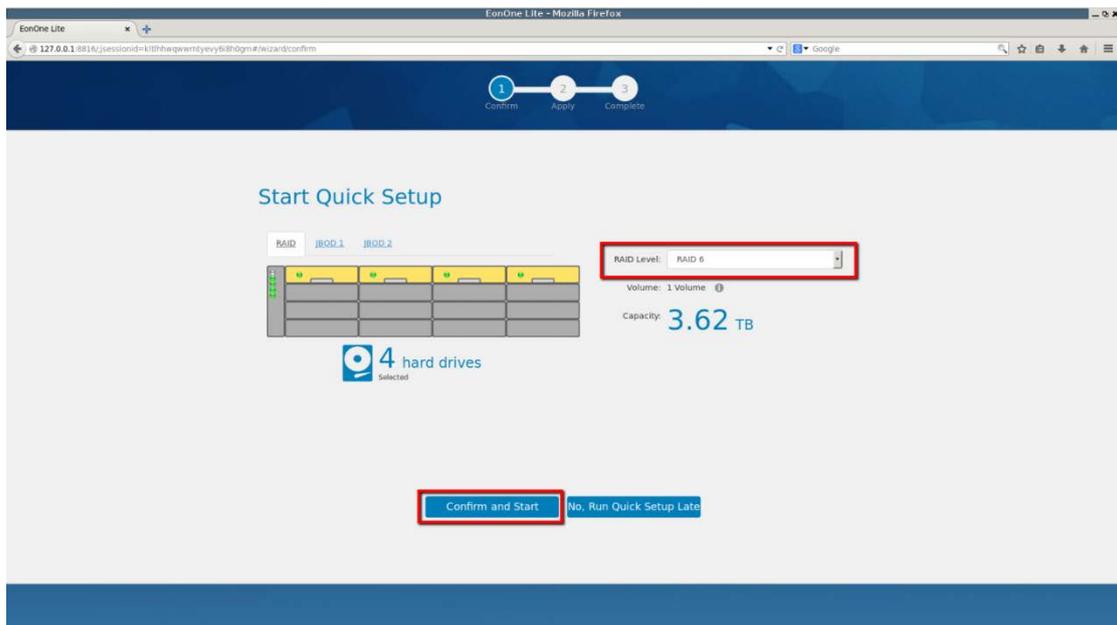

- The system will show this tip in pop-up window. Press “Continue”.

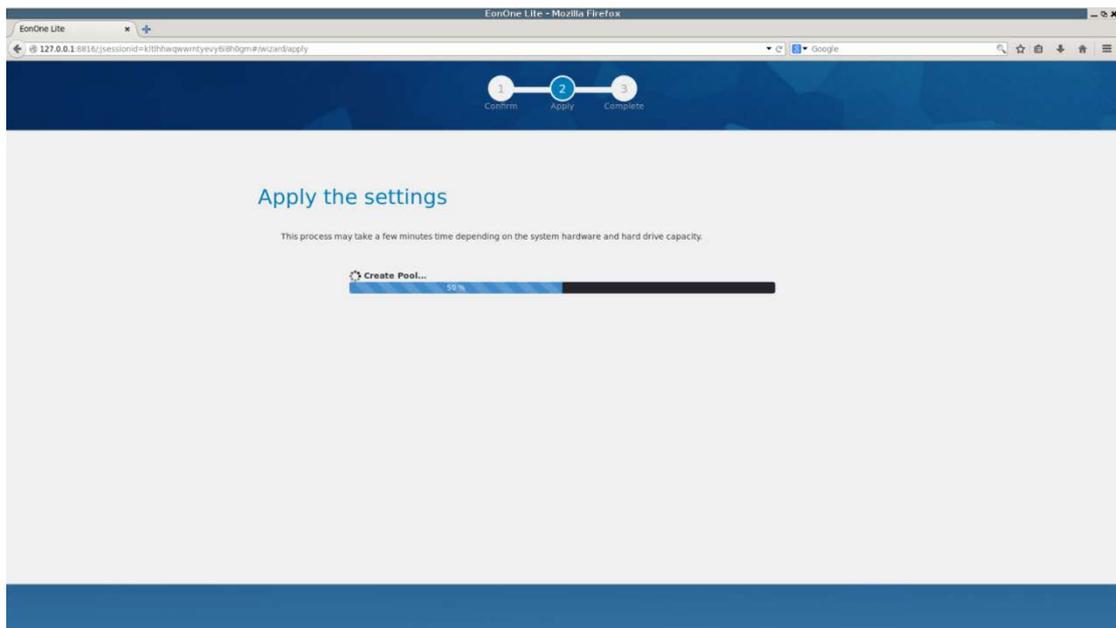

- Log in EonOneLite. The default username and password are: admin / admin.

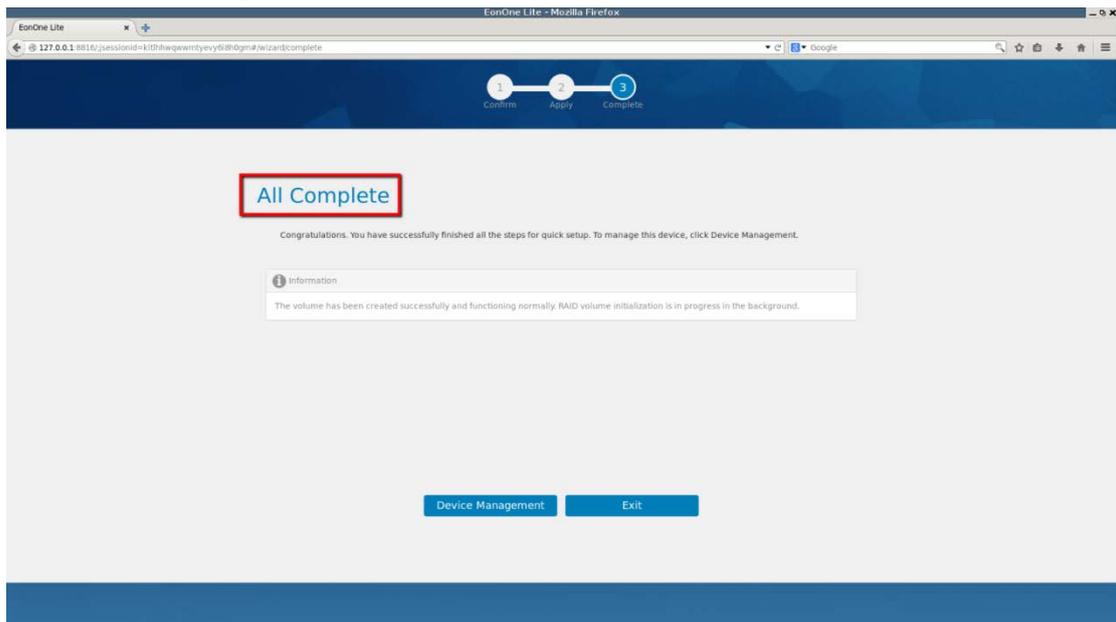

- EonOneLite will detect your HDDs. You can select one RAID level in the drop-down list and press "Confirm and Start" to process.

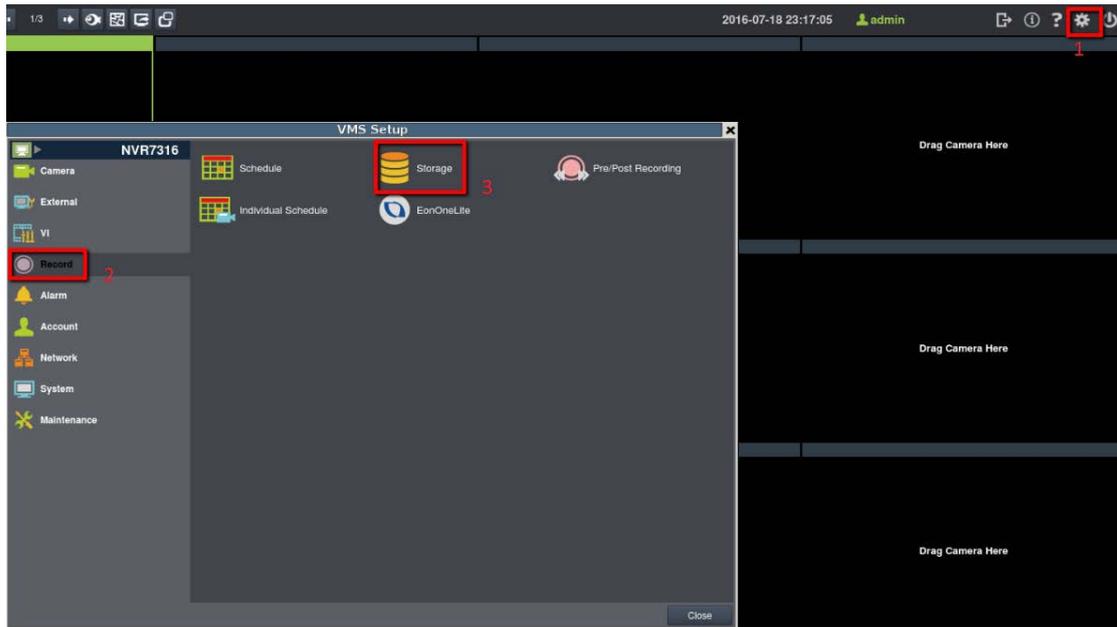

■ Please wait for a while.

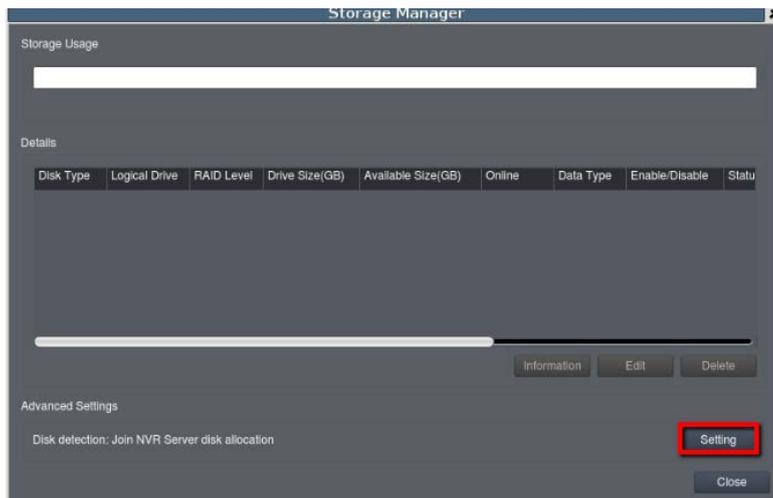

■ After finishing, it will show "All Complete" and press "X" or "Exit" to exit.

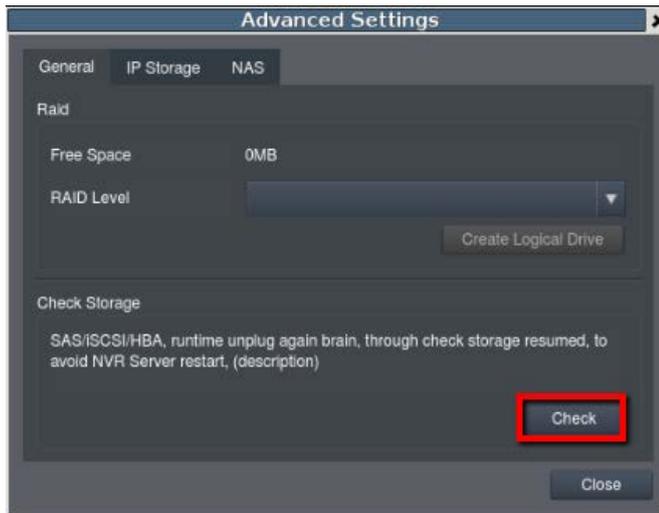

- Go to “Setup” ⚙️>“Record”> “Storage”.

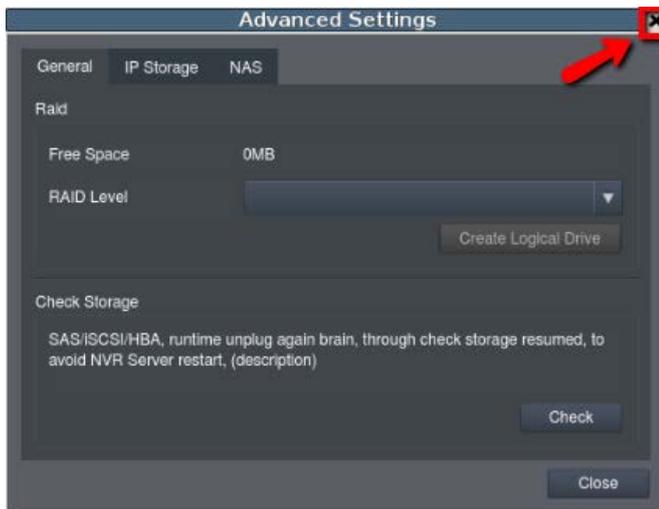

- Press “Setting”.

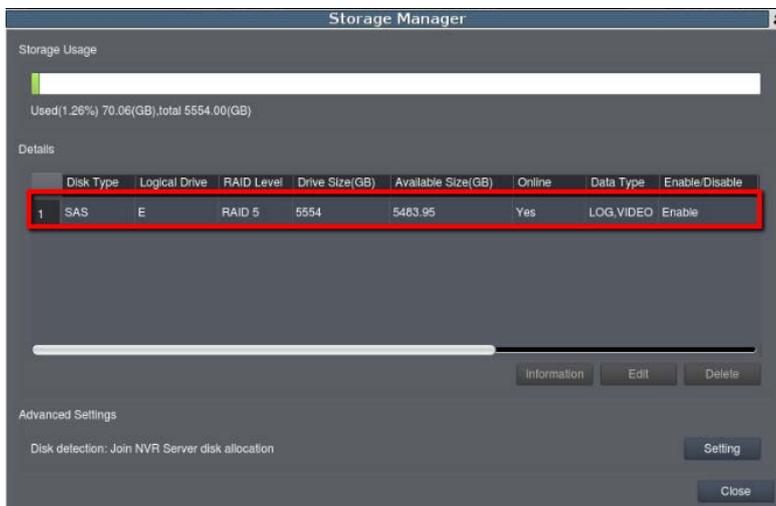

- Press “Check” and wait for a while.

- After finishing, press “X” or “Close” to close the window.

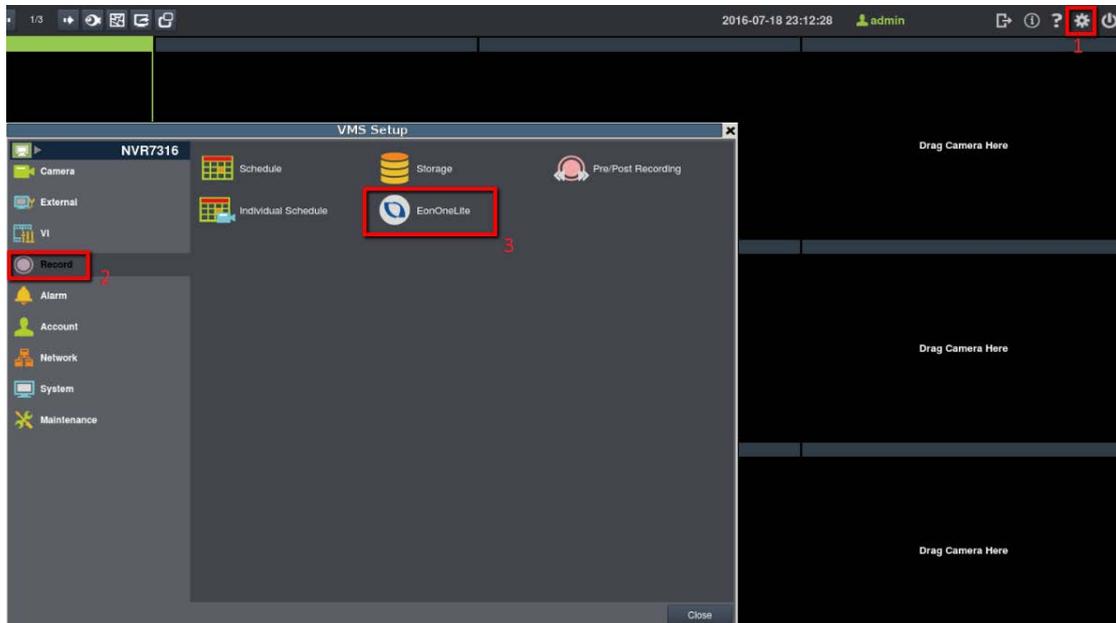

- You can see your RAID on the list.

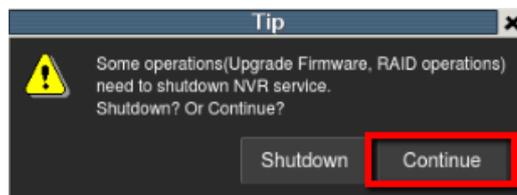

4. Create a RAID Array on JBOD1

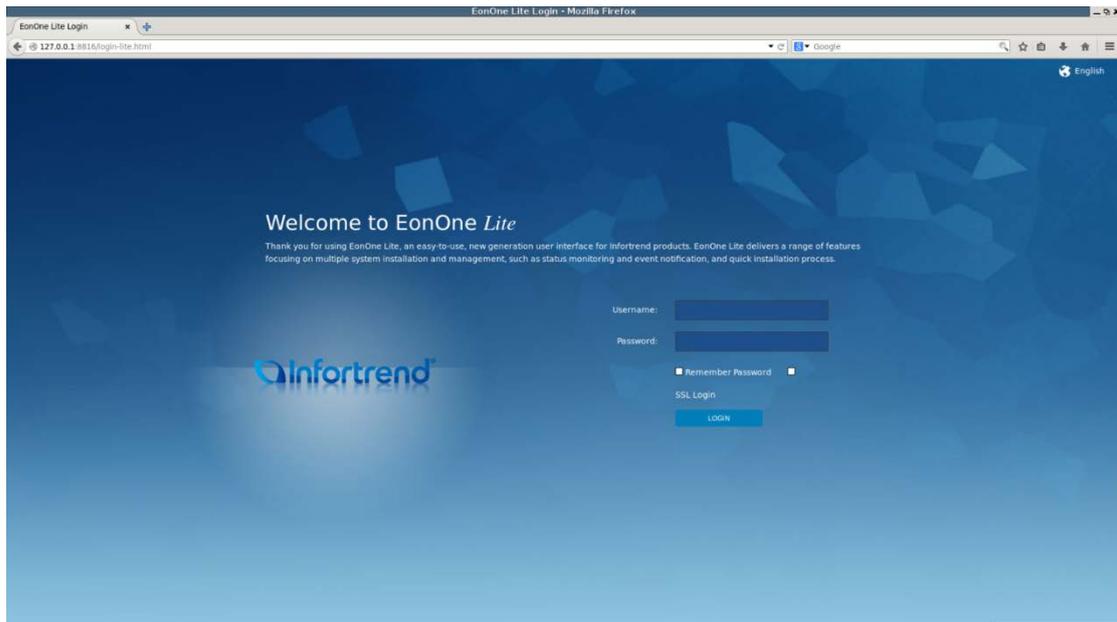

- Place HDDs into JBOD1.
- Go to NVR local server screen, “Setup” ⚙️>“Record”>“EonOneLite”.

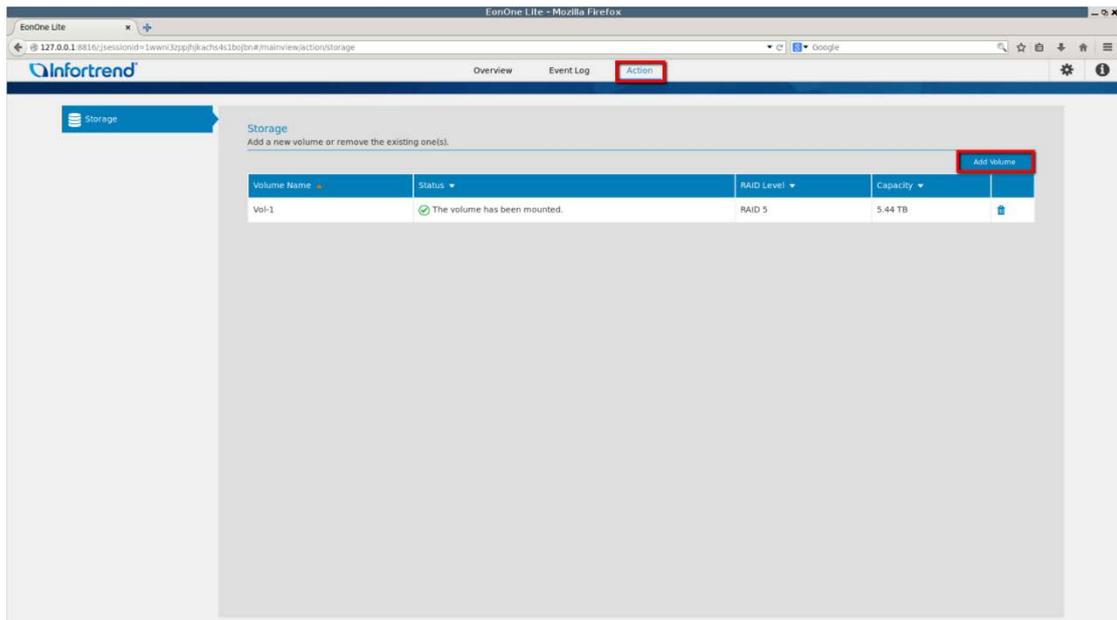

- The system will show this pop-up tip, and then press “Continue” to launch EonOneLite.

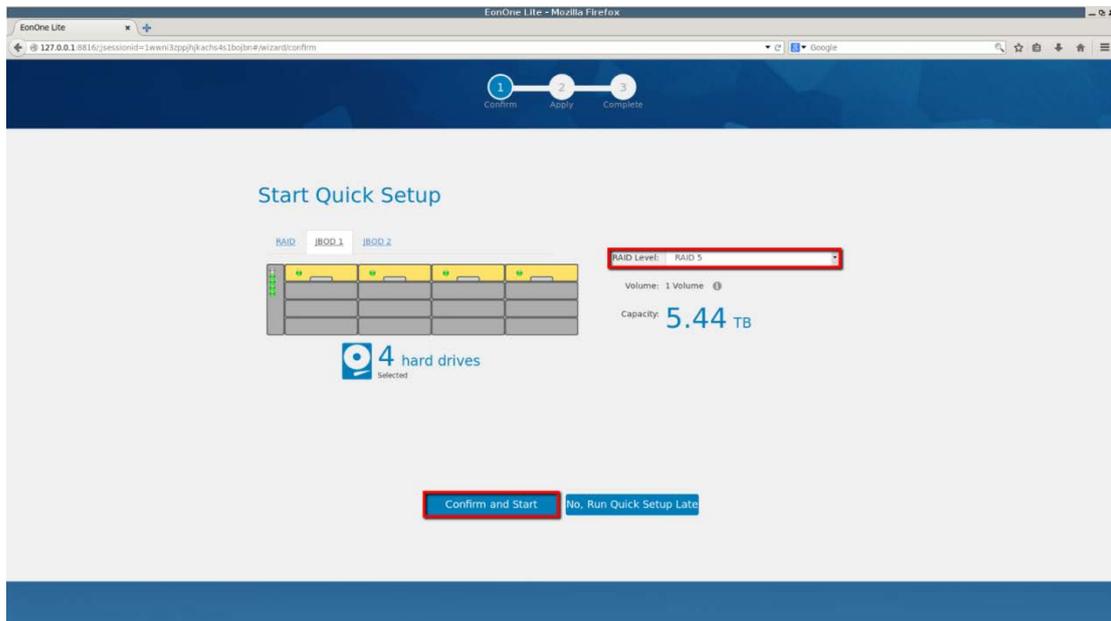

- Log in EonOneLite. The default username and password are: admin / admin.

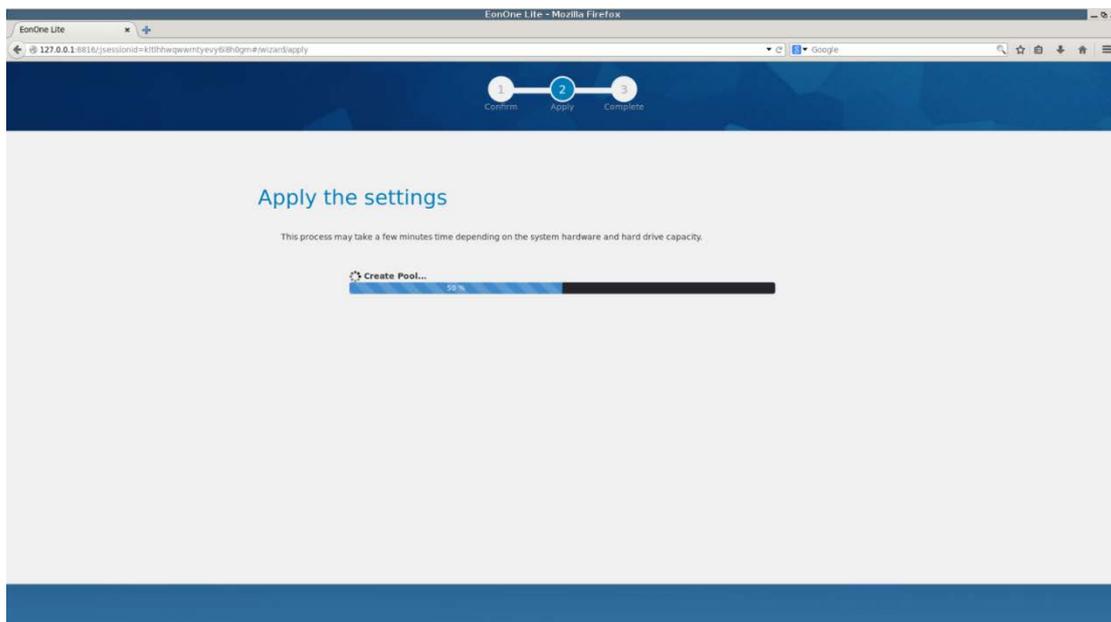

- Select "Action" tab and press "Add Volume".

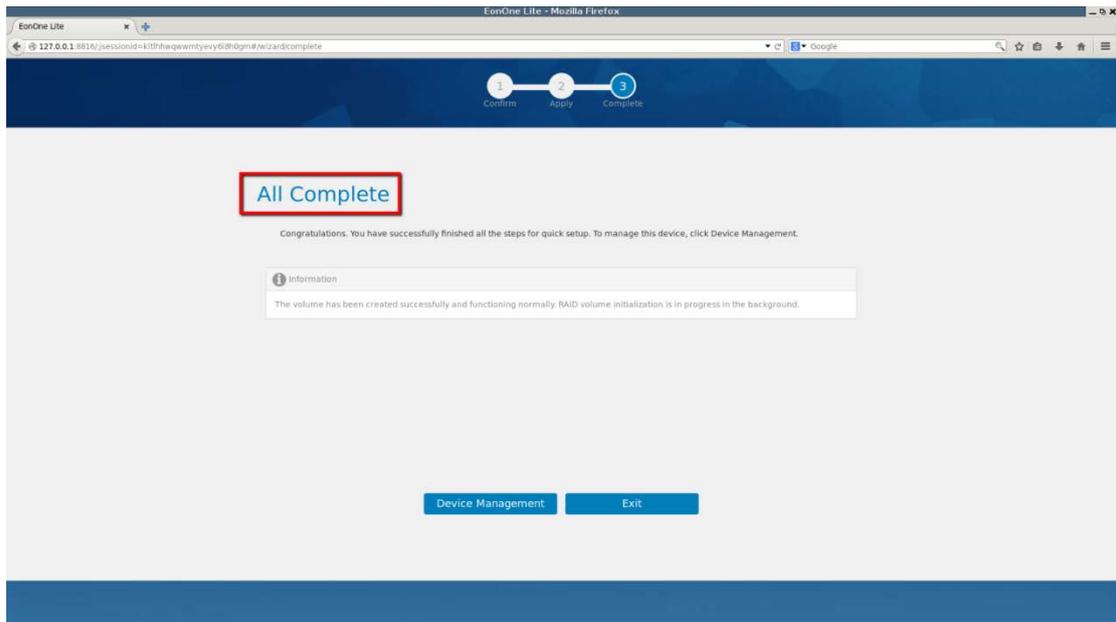

- EonOneLite will detect your HDDs. You can easily set your RAID level in this step. Select one JBOD tab. In RAID Level drop-down list, select one RAID Level for this JBOD. Press “Confirm and Start”.

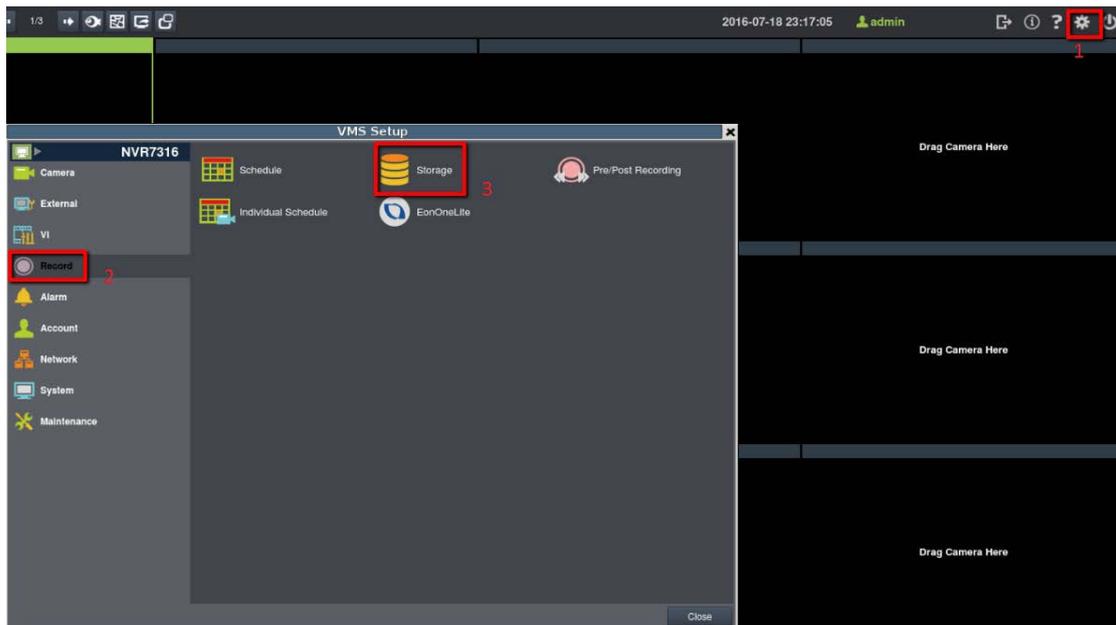

- Please wait for a while.

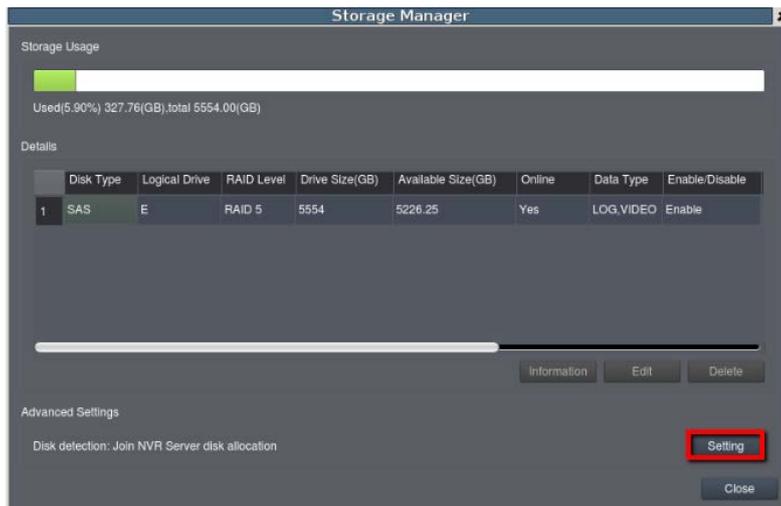

- After finishing, it will show “All Complete” and press “X” or “Exit” to exit.

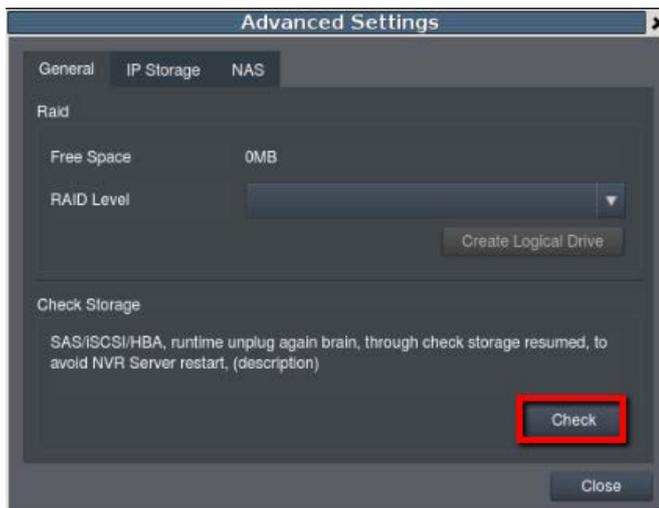

- Go to “Setup” ⚙️> “Record”> “Storage”.

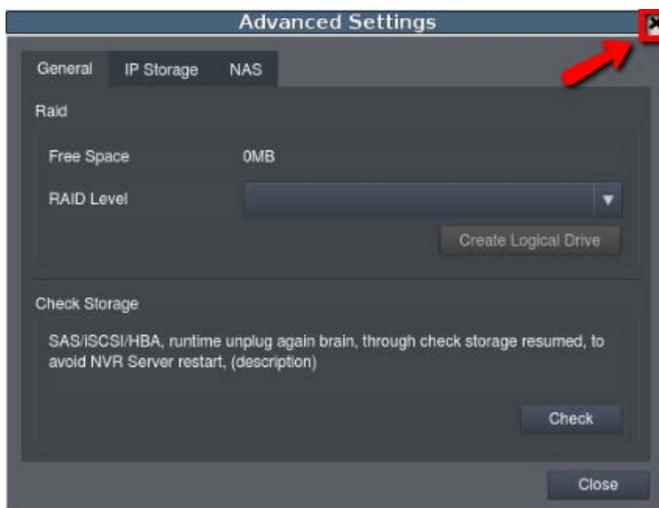

- Press “Setting”.

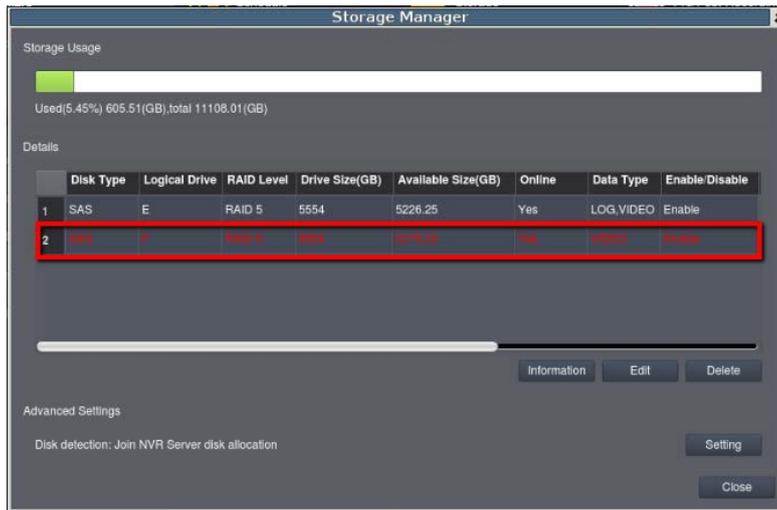

- Select “General” tab > “Check” and wait for a while.

- After finishing, press “X” or “Close” to exit.

- You can see your RAID on the list.

- ※ If you need to expand more JOBDs, repeat the same procedure above.
